

SB 1070 Theme-Based Portals and Fact Sheets

Introduction

This document describes a concept for using “theme-based web portals” as a means for organizing broader access to water quality and related data in California in order to meet the goals of SB 1070. These themes correspond to broad questions of interest both to managers and to the public and the portals are envisioned as providing a variety of levels of access to data analysis and assessment results, as well as to information on study designs and raw monitoring data.

The proposed themes reflect the strategic set of topics identified by the Surface Water Ambient Monitoring Program (SWAMP) for organizing a wide-reaching, statewide assessment program. The current status of the state’s ability to readily provide information on each theme is illustrated with representative webpages and assessment products and evaluated in terms of the 10 Elements of a State Water Monitoring and Assessment Program (USEPA 2003), which define the basic elements of an effective water quality monitoring program:

1. Strategy
2. Monitoring objectives
3. Monitoring design
4. Indicators
5. Quality assurance
6. Data management
7. Data analysis and assessment
8. Reporting
9. Programmatic evaluation
10. General support and infrastructure planning

These elements are essential to any monitoring and assessment effort that seeks to provide information useful in decision making and have been adopted by the Surface Water Ambient Monitoring Program (SWAMP) as the core structure of its statewide assessment program (Comprehensive Monitoring and Assessment Strategy, http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/cw102swampcmas.pdf).

The example cases presented for each theme are intended to fulfill the following purposes:

- Illustrate how the 10 elements provide a framework for evaluating monitoring and assessment programs and for highlighting aspects that require additional development
- In doing so, provide an initial set of benchmarks for tracking progress toward meeting the goals of SB 1070
- Identify themes, and related programs, that have met the criteria for technical rigor, coordination, and public access laid out in SB 1070
- Prioritize themes for further development both in 2008 and in subsequent years

Each theme is described in a fact sheet intended to furnish background information that supports the summary rating on the 10 elements and provides information for discussion by Monitoring Council members. Fact sheets for each theme are organized according to the following template:

- Title

- Website(s) (if applicable)
- Sponsor(s)
- Contact(s) (for purposes of this reporting effort only)
- Brief description, including purpose
- Evaluation of how well the theme meets the 10 elements
- Sample webpages
- Sample assessment products

Theme-Based Portal Concept

The Monitoring Council described a concept of theme-based portals that would provide ready access to a variety of assessment information.

These themes, though not yet explicitly defined, fall into two categories. One category would address core assessment questions or concerns, such as: Is seafood safe to eat? Is it safe to swim at the beach? What is the condition of streams? A second category would include certain kinds of foundational data (e.g., flow, landscape maps) that are needed for the assessment of questions about condition, status, or trends. Most of the case studies fall into the first category, with the remainder falling into the second.

The term portal refers to a web-based access point that would enable users to access data and assessment results from the perspective of a broadly meaningful question, and download data as needed. An effective portal would enable users to view issues, assessment results, and data from a variety of different views. Such views might include different spatial scales (national, statewide, regional, county, watershed, and local or site-specific). Perspectives could also include different assessment thresholds, supported by pre-programmed tools that would view the data through different screens. For example, USEPA suggests a range of risk levels in their guidance documents for assessing seafood consumption safety, while OEHHA uses a 10^{-4} risk level to account for the health benefits of consuming fish. Beach bacteria data provide another example, where users might want to screen the data in terms of comparison to compliance standards, the number and location of advisories, or the report card scores (i.e., A, B, C, D).

Portals should enable users to readily move between larger and smaller spatial scales as desired, and to access relevant data at each scale. For example, a discharger in the San Gabriel River might want to compare their bioassessment data to assessment results from the regional and then the statewide scales. This discharger should be able to obtain the assessment results at those different levels, and then be able to access reports, data, and assessment tools as needed.

A useful template for what a portal should look like is provided by the State of the USA website, www.stateoftheusa.org, which has the National Academies as a strategic partner and is funded by major foundations. This project aims to provide theme-based, question-driven access to reliable data and information on a range of environmental, economic, and social issues.

Proposed Themes

A variety of assessment programs have identified one or more of the following themes as focal points for their activities. Taken together, these themes the goals of the major ongoing monitoring and assessment efforts currently managed by The Resources Agency, CalEPA (especially the State Water Quality Control Board), and Department of Public Health. The proposed themes include:

- Swimming safety (related to pathogen contamination)
- Seafood consumption safety
- Drinking water safety

- Status of aquatic life

Each theme can be addressed in one or more of the following habitats:

- Streams
- Rivers
- Lakes
- Groundwater
- Coastal waters
- Bays and estuaries
- Wetlands
- Intertidal

Combining these overarching themes and habitats results in the matrix shown in Table 1, each cell of which can potentially be considered a distinct subtheme.

Table 1. Major subthemes resulting from the combination of core assessment questions and relevant habitats throughout the state.

Themes	Habitats							
	Freshwater				Marine and coastal			
	Streams	Rivers	Lakes	Ground-water	Coastal waters	Bays & estuaries	Wetlands	Intertidal
Swimming safety	X	X	X		X	X		
Seafood consumption safety	X	X	X		X	X		
Drinking water safety	X	X	X	X				
Status of aquatic life	X	X	X		X	X	X	X

Theme Fact Sheets

The following fact sheets score the current status of each theme in terms of the US EPA's ten elements of monitoring program design according to the scoring benchmarks in table 2.

Table 2. Scoring benchmarks for evaluating the degree to which each of the theme-based portals meets the ten evaluation criteria for monitoring and assessment programs.

Ten elements	Scoring benchmarks
Strategy	0: No core questions; no, or many undifferentiated, target audiences 5: Core questions and target audiences implicit in program design 10: Core questions standardized, clearly stated, and focused on specific audience(s)
Monitoring objectives	0: Data collection not organized around objectives, or many conflicting objectives 5: Objectives implicit but are only partly standardized and used to direct design effort 10: Clearly stated and common objectives address standardized core questions and inform all aspects of design
Monitoring design	0: Monitoring efforts uncoordinated, not focused on questions or

	<p>objectives</p> <p>5: Monitoring efforts focused on objectives, but are poorly documented and not coordinated statewide</p> <p>10: Standardized, optimized, and clearly documented design that meets monitoring objectives</p>
Indicators	<p>0: Indicators uncoordinated, not validated</p> <p>5: Indicators validated but not standardized statewide</p> <p>10: Standardized, scientifically validated, and clearly documented indicators</p>
Quality assurance	<p>0: No QA procedures or plan</p> <p>5: QA procedures exist but are poorly matched to objectives and not standardized statewide</p> <p>10: Standardized and clearly documented QA procedures match monitoring objectives</p>
Data management	<p>0: No data management procedures or documentation</p> <p>5: Data management procedures exist but are not standardized statewide and only poorly support access to data</p> <p>10: Standardized and clearly documented data management procedures are standardized statewide and fully support access to data at multiple levels</p>
Data analysis and assessment	<p>0: No data analysis or assessment procedures used or documented</p> <p>5: Data analyzed but methods not standardized; assessment tools exist but not fully validated or standardized</p> <p>10: Data analysis methods and assessment tools fully validated, clearly documented, and standardized statewide</p>
Reporting	<p>0: No reporting process or products</p> <p>5: Intermittent reports, available with some effort</p> <p>10: Readily available regular reports focused on core questions and objectives; ability to create user reports from multiple perspectives</p>
Programmatic evaluation	<p>0: No systematic program evaluation</p> <p>5: Intermittent internal program review</p> <p>10: Regular external program evaluations</p>
General support and infrastructure planning	<p>0: No formal planning</p> <p>5: Intermittent planning that may or may not include infrastructure needs</p> <p>10: Regular planning for all program needs</p>

Table 3. Scores for each major theme or subtheme on the ten elements of successful monitoring and assessment programs. Scores are assigned relative to the benchmarks in Table 2 and details are provided in the fact sheets below.

Theme: Swimming safety

Swimming safety is a concern in streams, rivers, lakes, coastal waters, and bays and estuaries where body contact recreation has been designated as a beneficial use. Risks to human health are managed by freshwater and marine standards for permissible levels of a set of bacterial indicators. There is a coordinated program in place for assessing and reporting on risks in coastal waters and bays and estuaries, but no similar activity for freshwater systems.

Subtheme: Freshwater swimming safety

Website: NA

Sponsor: Local and, in some cases, regional water quality agencies.

Contact: NA

Description: There is no web portal for freshwater monitoring data. There is little coordinated monitoring for human health risk in freshwater systems (i.e., streams, rivers, lakes) and no standardized assessment, reporting, or data access tools.

Evaluation of 10 elements:

1. Strategy: Freshwater monitoring (where it exists), focuses on a clear question, with specific audiences in mind
Score: 7
2. Monitoring objectives: The monitoring objective is to meet management / assessment needs and the public's interest in reliable, current information about water quality conditions where body contact recreation occurs. This objective is often poorly articulated for freshwater systems
Score: 4
3. Monitoring design: Monitoring designs for freshwater systems typically do not match the strategy and objectives, follow no standardized guidelines, and are not optimized for efficient information return
Score: 0
4. Indicators: Indicators for all habitats are standardized and well developed
Score: 10
5. Quality assurance: There is no standardized or systematic QA implemented for the various separate freshwater monitoring programs
Score: 2
6. Data management: There are no systematic data management procedures or systems applicable to freshwater monitoring
Score: 0
7. Analysis and assessment: There are no consistent data analysis or assessment procedures established for freshwater monitoring data
Score: 0
8. Reporting: There are no reporting tools available for freshwater monitoring data
Score: 0
9. Programmatic evaluation: There is no periodic program evaluation process for freshwater monitoring
Score: 0
10. Program planning: There is no planning process for freshwater monitoring
Score: 0

Sample webpages: NA

Sample assessment products: NA

Subtheme: Coastal swimming safety

Website: <http://www.healthebay.org/brc/statemap.asp>

Sponsor: State Water Board, Heal the Bay

Contact: Steve Weisberg, SCCWRP

Description: For coastal waters and bays and estuaries, the Beach Report Card system hosted at Heal the Bay's website aggregates shoreline monitoring data collected at the county level into a statewide database. A standardized risk-based water quality grading system applied to all data generates report card grades that are presented on a map-based interface. The beach grading system was developed through a collaborative statewide effort.

Evaluation of 10 elements:

1. Strategy: The program asks and answers a clear question for specific audiences
Score: 10
2. Monitoring objectives: The monitoring objective is clearly articulated and related to monitoring designs. The objective is to meet management / assessment needs and the public's interest in reliable, current information about water quality conditions where body contact recreation occurs
Score: 10
3. Monitoring design: Monitoring designs match the strategy and objective and follow guidelines established by the State Water Board's Beach Water Quality Workgroup. However, designs implemented by local and regional agencies are not fully standardized
Score: 7
4. Indicators: Indicators for all habitats are standardized and well developed; however, they are not described or referenced on the Beach Report Card website
Score: 9
5. Quality assurance: Data pathways and processing are well-developed and standardized among participants. Laboratory intercalibration studies have improved QA at the regional level, but QA implementation is the responsibility of individual reporting agencies. These QA procedures are not described on the Beach Report Card website, except in passing
Score: 5
6. Data management: A standardized set of data management tools enables local and regional agencies to load their data to a statewide database in a common format. However, these data management procedures and systems are not described on the Beach Report Card website. Underlying monitoring data not available for download
Score: 8
7. Analysis and assessment: Analysis and assessment for coastal waters and bays and estuaries follows standardized protocols agreed on by all parties; grading methods are described in detail on the Beach Report Card website, with reference to water quality standards. Assessment results are readily available on the website
Score: 10
8. Reporting: Interactive reporting tools are available on the Beach Report Card website at several levels of detail. The system provides map-based entry for report cards, and history, as well as the ability to search drop-down lists by beach for closures and history. Users have the option of selecting a different month via a drop-down menu on the map. Beach grades are available via texting to cell phone or other hand-held device. The history of grades and closures for each beach is also available
Score: 10
9. Programmatic evaluation: There is no description on the Beach Report Card website of a periodic program evaluation process for coastal waters and bays and estuaries
Score: 0
10. Program planning: There is no information on assessment of or planning for future program needs
Score: 0

Where's the Details?

You may have noticed that other beaches have much more information on their Beach Details pages (e.g. photos, maps, graphs, and related links). Unfortunately, we have not yet entered the detailed data for this particular beach.

Please see the [Beach Details - Select Location](#) page for a list of locations that has this additional information completed.

By providing beach details, Heal the Bay hopes to make the Beach Report Card an even more useful public health tool.

Theme: Seafood consumption safety

Seafood consumption safety is a concern in streams, rivers, lakes, coastal waters, and bays and estuaries where sport and commercial fishing, and shellfish harvesting, have been designated as beneficial uses. Both federal and state agencies have jurisdiction over this issue, but only the federal Food and Drug Administration (FDA) sets specific action levels and these only for commercial fish. California's Office of Environmental Health Hazard Assessment (OEHHA) sets threshold levels for certain chemicals in sportfish as the basis for establishing site- and species-specific consumption advisories. Neither federal nor state agencies conduct systematic tissue monitoring for risk assessment. OEHHA, however, has used monitoring data collected for other purposes for its assessments. For example, OEHHA has used data from SWAMP's statewide assessments of sportfish tissue contamination, although these studies were not designed to support human health risk assessment. A second program is the statewide monitoring of shellfish and marine biotoxins in coastal waters and bays and estuaries coordinated by the Department of Public Health in cooperation with a number of academic and other institutions.

Subtheme: Sportfish consumption safety

Website: www.oehha.ca.gov/fish/so_cal/index.html

Sponsor: Office of Environmental Health Hazard Assessment (OEHHA), State Water Board

Contact: Robert Brodgerg, OEHHA

Description: SWAMP's sportfish tissue assessment is intended to answer key questions about patterns of contamination in sportfish tissue in three major habitat types statewide – lakes, coastal environment, and streams. The major focus of this study is the 305(b) water quality assessment, not specifically human health risk assessment. Tissue data were obtained from a wide range of available sources to provide an initial statewide assessment. This was followed by a statewide survey of lakes in 2007 and 2008. The coastal habitat will be sampled next, followed by the stream habitat, before cycling back to lakes in subsequent years. There is the possibility that SWAMP's program could be revised to better address seafood consumption risk, but this has not yet occurred.

Evaluation of 10 elements:

1. Strategy: SWAMP's assessment asks and answers clear questions, with specific audiences in mind; however, this strategy does not focus specifically on consumption safety, nor is it coordinated with those in the shellfish subtheme
Score: 8
2. Monitoring objectives: SWAMP's objective is to provide data for the 303(d) listing and the 305(b) reporting processes (not specifically consumption safety), and is not coordinated with those for the shellfish subtheme
Score: 8
3. Monitoring design: While the program began with an assessment of all readily available data that passed a QA screening, the long-term monitoring design is a combination of probabilistic sampling intended to characterize statewide conditions and targeted sampling that focuses on the most popular fishing sites. This was the design used for the 2007 – 2008 study of tissue levels in lake fish
Score: 10
4. Indicators: Indicators, i.e., tissue measurements, are standardized, with well-developed sampling and laboratory procedures
Score: 10
5. Quality assurance: QA methods are well developed and described in the SWAMP QAPP. Data must meet SWAMP QA standards before entry into the SWAMP database
Score: 10

6. Data management: Data management procedures are well established, but have yet to be placed into a readily available format usable by OEHHA and the State and Regional Water Boards. Data are currently stored at SFEI and are not yet available online
Score: 6
7. Data analysis and assessment: OEHHA has developed a formal data analysis framework for the purpose of developing consumption advisories
Score: 10
8. Reporting: Draft reports are being prepared for the initial phases of this program to meet SWAMP's 305(b) reporting responsibilities. OEHHA posts reports and consumption advisories on its website. The longer-term plan is to make all data available through an online interactive mapping tool being developed at SFEI for the Fish Mercury Project being funded primarily by CALFED
Score: 7
9. Programmatic evaluation: No description of a periodic program evaluation process
Score: 0
10. Program planning: No information on assessment of or planning for future program needs
Score: 0

Sample webpages:

The screenshot shows the OEHHA (Office of Environmental Health Hazard Assessment) website. The browser title is "OEHHA Fish: Safe Eating Guidelines - Mozilla Firefox". The address bar shows the URL "http://www.oehha.ca.gov/fish/so_cal/index.html". The website header includes the OEHHA logo and navigation tabs for Home, Air, Children's Health, Ecotoxicology, Emergency, Fish, Pesticides, Proposition 65, Risk Assessment, and Water. The main content area is titled "SAFE EATING GUIDELINES" and includes a paragraph explaining that OEHHA has issued fish consumption advice for various water bodies in California. A list of advisories is provided, including Trinity River Watershed, Black Butte Reservoir, Lower Feather River, Lake Pillsbury, Clear Lake, Cache Creek, and Bear Creek, Putah Creek, Lake Sonoma, Lake Berryessa, Lake Herman, Sacramento River and Northern Delta, Safety of Consuming Fish and Shellfish from Areas Impacted by the M/V Cosco Busan Oil Spill, San Francisco Bay and Delta Region, and Northern Sierra Nevada Foothills. An image shows a group of people, including children, gathered around a table outdoors, possibly at a community event or market. The right sidebar contains "OEHHA FISH LINKS" and "EXTERNAL FISH RESOURCES". The left sidebar lists "MOST POPULAR LINKS", "LISTSERVS", and "CONTACT OEHHA".

SAFE EATING GUIDELINES
OEHHA has issued fish consumption advice for a number of water bodies in California where chemical contamination in fish poses a health concern. Links to the advisories OEHHA has developed and issued to date are provided below. These advisories are followed by interim advisories that have also been issued by counties in cooperation with OEHHA. To read the advice for a specific location and find other materials related to that advisory, such as reports and fact sheets, follow the link for the location that interests you.

Advisories issued by OEHHA:
OEHHA's advisories, listed below, are arranged generally from north to south.

Sample assessment products:

Subtheme: Shellfish consumption safety

Website: <http://www.cdph.ca.gov/HealthInfo/environhealth/water/Pages/Shellfish.aspx>.

Sponsor: Department of Public Health

Contact: Gregg Langlois, DPH.

Description: The Department of Public Health's Preharvest Shellfish Protection and Marine Biotxin Monitoring Program monitors commercial shellfish growing areas in conformance with the National Shellfish Sanitation Program. The program also monitors numerous points along the California coastline for marine biotoxins in shellfish and toxigenic phytoplankton in marine waters. Warnings are issued or quarantines are established as needed for recreational and commercial shellfish harvesting. These programs are separate and not coordinated.

Evaluation of 10 elements:

1. Strategy: The program asks and answers clear questions, with specific audiences in mind
Score: 10
2. Monitoring objectives: The objective has been clearly stated and is to describe broad trends over time, and DPH's objective is to establish sanitary requirements for shellfish growing waters and to regulate commercial growing and harvesting to ensure shellfish are safe for human consumption
Score: 10
3. Monitoring design: The monitoring design is based on national guidelines promulgated by the Food and Drug Administration, although these allow for a degree of local flexibility. Monitoring is conducted by a wide range of collaborating local partners and is more organized and consistent for shellfish growing sites than for phytoplankton and toxins in marine waters
Score: 5
4. Indicators: Taxonomic methods for phytoplankton identification and methods for the direct measurement of marine biotoxins are not standardized. However, NOAA is organizing a nationwide methods intercalibration study for 2009, with the goal of improving standardization of methods for species identification and estimating abundance, as well as for toxin identification and measurement
Score: 4
5. Quality assurance: Laboratory QA methods are defined in national procedure manual, however, there is no readily available information on the degree to which these QA standards are met, or on data checking and validation methods further along the data path
Score: 5
6. Data management: There is no readily available information on data management procedures. However, the program produces aggregated statewide reports, which requires that data be collected and housed in a statewide database. The program does not provide users a means to access and download data. However, it has recently implemented a statewide listserve to enable participants to more readily share data and results
Score: 5
7. Data analysis and assessment: Standardized data summarization approaches are used, with assessment thresholds applied to data on toxin levels in shellfish as a basis for regulatory decisions
Score: 7
8. Reporting: The program regularly produces monthly, quarterly, and annual reports, which are posted on the program's website. However, users cannot create reports based on individual criteria
Score: 8
9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Sample webpages:

The screenshot shows a Mozilla Firefox browser window with the address bar containing <http://www.cfsan.fda.gov/~ear/nss3-toc.html>. The page header features the FDA logo and the text "U.S. Food and Drug Administration" and "CENTER FOR FOOD SAFETY AND APPLIED NUTRITION". A navigation bar includes links for "FDA Home Page", "CFSAN Home", "Search/Subject Index", "Q & A", and "Help". The main content area has a light blue background with the title "National Shellfish Sanitation Program Guide for the Control of Molluscan Shellfish 2005". Below the title, a link indicates the document is available in PDF (3.7 MB) for printing. A paragraph of text explains the document's purpose and legal status. At the bottom, logos for the U.S. Department of Health and Human Services and the Interstate Shellfish Sanitation Conference are displayed.

National Shellfish Sanitation Program
Guide for the Control of Molluscan Shellfish
2005

This document also available in [PDF](#) (3.7 MB) for printing

This document is intended to provide guidance and shall supersede the 2003 NSSP Model Ordinance. It represents the Agency's current thinking on the safe and sanitary control of the growing, processing, and shipping of molluscan shellfish for human consumption. It does not create any rights for or on any persons and does not operate to bind FDA or the public under federal law. However, through their participation in the National Shellfish Sanitation Program and membership in the Interstate Shellfish Sanitation Conference, states have agreed to enforce the Model Ordinance as the requirements which are minimally necessary for the sanitary control of molluscan shellfish.

Done

Theme: Drinking water safety

Drinking water safety is a concern for all bodies of freshwater, both surface water and groundwater, that may be sources of drinking water. Risks to human health are managed by state and local standards for permissible levels of certain contaminants. Surface water quality is monitored by the USGS National Water Quality Assessment program, as well as by a large number of NPDES and regional assessment programs. Groundwater quality is monitored and tracked by the State Water Board's GAMA and GeoTracker programs, respectively.

Subtheme: Surface water safety

Website: <http://ca.water.usgs.gov/nawqa.html>; NA for NPDES programs

Sponsor: US Geological Survey, Regional Water Boards

Contact: Mike Shulters, USGS; Val Connor, State Water Board

Description: Surface waters are monitored by an integrated, statewide monitoring program designed and implemented by USGS as part of its National Water Quality Assessment Program (NAWQA). NAWQA was initiated in 1991 to assess the status of and trends in the quality of freshwater streams and aquifers, and to provide a sound understanding of the natural and human factors that affect the quality of these resources. Monitored assessment areas account for 60 to 70 percent of the Nation's water use and population served by public water supplies, and cover about one-half of the land area of the Nation. At the other extreme of organization, surface water quality, including for drinking water beneficial uses, is monitored throughout the state under the terms of NPDES permits for point and nonpoint discharges, as well as by a number of regional monitoring and/or assessment programs. These NPDES programs are typically completely independent and uncoordinated.

Evaluation of 10 elements:

1. Strategy: The program asks and answers clear questions, with specific audiences in mind
Score: 10
2. Monitoring objectives: Objectives are defined at a range of scales, from nationwide to basin-level, all related to the basic purpose of tracking patterns and trends in water quality
Score: 10
3. Monitoring design: Designs are clearly defined and nested within nationally and regionally standardized frameworks
Score: 10
4. Indicators: Indicators are well developed and standardized nationally and regionally
Score: 10
5. Quality assurance: QA is a centrally important feature of all USGS programs, with formal QA procedures established and documented by the National Water Quality Laboratory. Additional, study-specific QA issues are addressed in the methods section of each assessment report
Score: 10
6. Data management: Data management procedures are well established, standardized nationwide, and clearly documented. Data are housed in readily accessible databases and can be searched and downloaded from a variety of perspectives, including by drop-down lists of locations and data types, or through map-based interactive interfaces. The program's website has clear instructions and tutorials for public access and to provide data downloads to a variety of formats, including GIS
Score: 10
7. Data analysis and assessment: A variety of analysis and assessment approaches are used to address questions at the national, regional, and basin-specific levels. These approaches are subject to both internal and external peer review
Score: 10

8. Reporting: Assessment reports are the primary vehicle for disseminating program results and are readily available on the program's website. These cover a wide range of topics related to water quality and the processes affecting it. However, there are no interactive features in these reports to enable users to focus on a specific area or directly obtain the underlying data through a link to the database

Score: 8

9. Programmatic evaluation: The program does not undergo a formal external review, but its methods, designs, assessment approaches, and products are continually reviewed and commented on by peer reviewers, partners, and customers

Score: 10

10. Program planning: Year-to-year and longer-range planning occurs at the national and regional levels within USGS. This planning includes staffing and infrastructure needs, but is subject to the uncertainties of the federal budget process

Score: 10

Santa Ana Basin, National Water Quality Assessment Program

Search California Water Science Center site only:

Santa Ana Basin

In 1991 the U.S. Geological Survey initiated the **National Water-Quality Assessment (NAWQA) Program** to assess the status and trends in the quality of freshwater streams and aquifers, and to provide a sound understanding of the natural and human factors that affect the quality of these resources. As part of the program, investigations will be conducted in 59 areas--called "**study units**"-- throughout the Nation to provide a framework for national and regional water-quality assessment. Together, these areas account for 60 to 70 percent of the Nation's water use and population served by public water supplies, and cover about one-half of the land area of the Nation.

EXPLANATION

0 10 20 MILES
0 10 20 KILOMETERS

■ CONSOLIDATED ROCK
 / SUBUNIT BOUNDARIES

In general, the quality of surface and ground water in the Santa Ana Basin becomes progressively poorer as water moves along hydraulic flow-paths. The highest quality water is typically associated with tributaries flowing from surrounding mountains and ground water recharged by these streams. Water quality is altered by a number of factors including consumptive use, importation of water high in dissolved solids, run-off from urban and agricultural areas, and the recycling of water within the basin.

As part of the NAWQA program, the U.S.G.S. is evaluating water quality in the **Santa Ana Basin**. The Santa Ana River is the largest stream system in southern California and the study unit covers an area of about 2,700 square miles in parts of Orange, San Bernardino, Riverside, and Los Angeles Counties. The study unit is home to more than 4 million people who not only rely on water resources that originate within the basin, but also on water imported from northern California and the Colorado River.

Beginning in 1999, and continuing for a period of three years, the Santa Ana NAWQA project intensively investigated the quality of water resources in the study unit. The largest and most important component of the intensive-study phase was an "Occurrence and Distribution Assessment". The goal of this assessment was to characterize, in a nationally consistent manner, the broad-scale geographic and seasonal variations of water-quality related to major contaminant sources and background conditions.

Data Portals

Sample assessment products:

Subtheme: Groundwater safety

Websites: GAMA – <http://www.waterboards.ca.gov/gama>; GeoTracker – <https://geotracker.waterboards.ca.gov/>

Sponsor: GAMA – State Water Board, US Geological Survey; GeoTracker – State Water Board

Contact: GAMA – John Borkovich, State Water Board; GeoTracker – Val Connor, State Water Board

Description: GAMA is a cooperative program of the State Water Board and the US Geological Survey that addresses concerns about groundwater contamination and its impacts on public water wells and water supply. GAMA is a comprehensive ambient groundwater quality monitoring plan with the objectives of improving statewide ambient groundwater quality monitoring and assessment and increasing the availability of information about groundwater quality to the public. GeoTracker is a State Water Board database that centralizes locally-collected information about spills, groundwater contamination, and cleanup status.

Evaluation of 10 elements:

1. Strategy: Both programs ask and answer clear questions, with specific audiences in mind, but their strategies are not coordinated

Score: 8

2. Monitoring objectives: GAMA's objectives are clearly stated on the program's website and in a number of descriptive and technical program document. More general objectives (e.g., better understand and identify risks to ground-water resources) are then supplemented with detailed monitoring objectives linked to specific monitoring designs. GeoTracker's objectives are to gather, organize, and provide access to information on cleanup sites in California. The programs' objectives are not coordinated

Score: 8

3. Monitoring design: GAMA is based on an integrated statewide design based on a division of the state into a number of groundwater basins ranked by a systematic prioritization process. The design is described in technical documents available on the program's website. GeoTracker does not itself conduct any monitoring. Data are submitted by local agencies in compliance with State Water Board regulations that require the electronic submittal of information on all cleanup actions. The programs' designs are not coordinated

Score: 8

4. Indicators: GAMA samples a standardized set of indicators sampled statewide. Indicators include a broader set of parameters, sampled at much lower detection limits, than required by DHS. Indicators and sampling methods are described in technical documents available on the program's website. GeoTracker clearly defines information types in the electronic submission procedure; these include primarily programmatic information such as cleanup status. The programs' indicators are not coordinated

Score: 8

5. Quality assurance: QA is a centrally important feature of all USGS programs such as GAMA, with formal QA procedures established and documented by the National Water Quality Laboratory. Additional, study-specific QA issues are addressed in the methods section of each assessment report. GeoTracker includes no description of any QA screening of submitted data, nor of how data re generated and evaluated at the local level. It is thus not possible to judge the quality of data in the database

Score: 5 (10 for GAMA, 0 for GeoTracker)

6. Data management: GAMA's data management procedures are well established, standardized statewide, and clearly documented. However, there are no query or download features to enable users to search, select, and download data. A planned link with the Geotracker website will provide these functions. GeoTracker's data management procedures are not described on the

website, but must be defined somewhere in order for the program to function. The system has an online tutorial that provides instructions for data access and download

Score: 6

7. Data analysis and assessment: GAMA uses a variety of analysis and assessment approaches are used to address questions at the national, regional, and basin-specific levels. These approaches are subject to both internal and external peer review. GeoTracker conducts no analysis or assessment

Score: 10

8. Reporting: GAMA uses assessment reports as the primary vehicle for disseminating program results and these are readily available on the program's website. Reports cover a wide range of topics related to program methods and monitoring and assessment results. However, there are no interactive features in these reports to enable users to focus on a specific area or directly obtain the underlying data through a link to the database. GeoTracker enables users to search the database by a variety of entry points, including county, groundwater basin, watershed, and address. Search results include maps, project status, and background information

Score: 9

9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

GAMA: Groundwater Ambient Monitoring & Assessment Program

Californians are concerned about groundwater quality, especially since groundwater accounts for up to 40 percent of the state's water supply. Since 1984, over 8,000 public water wells have been shut down - some due to the detection of chemicals such as MTBE, solvents, and perchlorate. To address these concerns, the state legislature* required that the State Water Board develop a comprehensive ambient groundwater quality monitoring plan. The Groundwater Ambient Monitoring Assessment (GAMA) Program was created by the State Water Board as a result of these concerns.

The main objectives of the GAMA Program are to improve statewide ambient groundwater quality monitoring and assessment and to increase the availability of information about groundwater quality to the public. Stewardship of the state's groundwater resources is the shared responsibility of all levels of the government and community. Participation in the GAMA Program is voluntary.

GAMA has produced several products on groundwater quality investigations throughout California. These products can be found [here](#).

Theme: Status of aquatic life

The protection of aquatic life is a central part of the management and regulatory programs maintained by CalEPA and The Resources Agency. For example, the protection of aquatic life beneficial uses is mandated in NPDES discharge permits and the Department of Fish and Game monitors the status of many marine and freshwater fisheries stocks. Aquatic life is managed from both species-specific (e.g., Coho salmon) and a habitat (e.g., rocky reefs) perspectives.

Subtheme: Wadeable streams

Website:

http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/assess_socal2004.pdf

http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/factsheets/305breport2006.pdf

Sponsor: State Water Board

Contact: Val Connor, State Water Board

Description: This program is intended to answer key questions about water quality and biological condition in wadeable streams statewide. A randomized design with standardized indicators provides the ability to assess overall water quality and ecological condition, estimate the proportion of wadeable streams falling into different categories of condition, and track changes in these measures over time. Monitoring results also help in prioritizing problem areas for further investigation. The program is implemented as a cooperative effort between the State Water Board and the Regional Water Boards.

Evaluation of 10 elements:

1. Strategy: The program asks and answers clear questions, with specific audiences in mind
Score: 10
2. Monitoring objective: The monitoring objective is to assess the percentage of stream miles falling into different condition categories and to track how those percentages change over time
Score: 10
3. Monitoring design: The monitoring design is specifically tailored to match the strategy and objective. It is well-described, standardized, and implemented consistently statewide
Score: 10
4. Indicators: Indicators are centrally developed and standardized, with training available in field procedures. There is ongoing methods comparison research on bioassessment methods and to determine if CRAM (California Rapid Assessment Protocol) can provide equivalent results for less cost. Procedure manuals and indicator descriptions are available on the SWAMP website
Score: 10
5. Quality assurance: QA is a central part of the program, with standardized methods and data required to meet SWAMP QA standards before entry into the SWAMP database
Score: 10
6. Data management: Data management procedures are well established. Data are stored in the BDAT / CEDEN database in a standardized format and are available for search and download to any interested user
Score: 10
7. Data analysis and assessment: Analysis and assessment follows detailed and standardized protocols described in the assessment report in greater detail in a series of technical reports available on the SWAMP website. The assessment approach allows for examination of status and trends at the statewide, regional, watershed, and site-specific level
Score: 10
8. Reporting: A statewide assessment report is available on the SWAMP website. However, there are no interactive features to enable users to focus on a specific area or directly obtain the underlying data through a link to the database
Score: 8

9. Programmatic evaluation: No description of a periodic program evaluation process, although the SWAMP as a whole recently underwent a thorough external evaluation
Score: 3
10. Program planning: No information on assessment of or planning for future program needs, although SWAMP is currently developing a longer-range business plan
Score: 3

http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/factsheets/305breport2006.pdf

Sec1:40 (42 of 82) 115%

Macroinvertebrate Observed/Expected Index

The California O/E index developed by Hawkins (unpublished) has a three-class hydro-climatic classification. Class 1 is "wet and cool," class 2 is "dry, warm, and flashy," and class 3 is "mesic and cold." All sites are assigned to the appropriate class based on precipitation and/or temperature. Predictor variables vary according to class.

Statewide, 33% of the stream length was estimated in "impaired" condition with respect to macroinvertebrate biotic integrity using the California O/E index (Figure 7; Ode and Rehn, 2005).

California Condition Assessments

Assessment Method	Impaired (%)	Non-impaired (%)
(a) Macroinvertebrate IBI	22%	78%
(b) Macroinvertebrate O/E index	33%	67%

Legend:

- Impaired (Red)
- Non-impaired (Green)
- Klamath Mountains (Blue)
- Coast Range (Orange)
- Southern California Mountains (Yellow)
- Southern and Central California chaparral and oak woodlands (Green)
- Regional Board boundaries (Black line)

Figure 7. Proportion of stream length statewide in the various condition categories based on the (a) macroinvertebrate IBI, and (b) macroinvertebrate O/E indices. Each site is assigned a "weight" equal to the number of stream kilometers represented by that sample reach. Results are based on benthic macroinvertebrate data collected as part of the EMAP-Inland Surface Waters program. Sites were selected using a statistical sampling design in which every element of the population has a known probability of being selected. The sites were intended to be representative of all wadeable streams of the state.

http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/factsheets/305breport2006.pdf

Macroinvertebrate Observed/Expected Index

The California O/E index used is the same one developed by Hawkins (unpublished) and described under the "Statewide Condition" section of this chapter.

More than 60% of the wadeable stream length was found to be in "non-impaired" condition with respect to macroinvertebrate biotic integrity using the California O/E index (Figure 10; Ode and Rehn, 2005).

Southern Coastal California Condition Assessments

(a) Macroinvertebrate IBI: 34% Impaired, 66% Non-impaired

(b) Macroinvertebrate O/E index: 33% Impaired, 67% Non-impaired

Legend:

- Impaired (Red)
- Non-impaired (Green)
- Southern California Mountains (Orange)
- Southern and Central California chaparral and oak woodlands (Yellow)
- Regional Board boundaries (Blue line)

October 2006

testing with different species. Nitrate ratings are based on the concentrations of nitrate nitrogen measured in water column samples.

Relative IBI Rankings for Santa Clara River SWAMP Sites (2001, 2003)

The map displays the Santa Clara River and its tributaries. Sites are marked with colored circles: green for 'Good', yellow for 'Marginal', and red for 'Poor'. Full circles represent sites sampled once (2001 or 2003), while half-circles represent sites sampled in both years. A legend on the right identifies symbols for Streams, Lakes, Wetlands, and Region 4 Boundary. Below the legend, a color-coded scale for 'Reaches' is shown, ranging from 1 (blue) to 11 (red). A scale bar at the bottom indicates distances up to 40 miles, and a north arrow is present.

Figure 11. Relative IBI rankings for Santa Clara River SWAMP sites. [Note: Full circles indicate that sites were sampled once, either in 2001 or 2003; half-circles indicate that sites were sampled during both 2001 and 2003. "Good" is defined as "high" quality, "marginal" is defined as "moderate" quality, and "poor" is defined as "low" quality.]

Based on the South Coast IBI, only about 24% of the stream miles support high quality benthic conditions.

8.50 x 11.00 in

Done

Subtheme: Streams – fisheries

Website: www.calfish.org/portals/2/Home/tabid/70/Default.aspx

Sponsor: The Resources Agency, Department of Fish and Game, Department of Water Resources, Coastal Conservancy, Caltrans, Pacific States Marine Fisheries Commission, NOAA Fisheries

Contact: NA

Description: This coordinated, state and federal interagency effort is intended to create, maintain, and enhance high quality, consistent data that are directly applicable to policy, planning, management, research, and recovery of anadromous fish and related aquatic resources in California, and to provide data and information services in a timely manner in formats that meet the needs of users. Its primary intent is to centralize access to fisheries and habitat monitoring and assessment data in California. This will make it much easier to develop and maintain statewide data standards and promote further development of related data programs.

Evaluation of 10 elements:

1. Strategy: The portal's overall strategy is broad but clearly stated
Score: 10
2. Monitoring objectives: Monitoring objectives are defined by each of CalFish's cooperating agencies and vary depending on each agency's mission and the goals of specific programs. Monitoring objectives are available through links to agency programs provided on the website
Score: 7
3. Monitoring design: As for monitoring objectives, monitoring designs are defined by CalFish's cooperating agencies and vary depending on individual program goals. Designs for many programs are available through links provided on the website
Score: 7
4. Indicators: Monitoring indicators focus on measures of abundance and distribution and the cooperating agencies work to standardize these across programs. However, there is no information about standardization efforts directly available on the website
Score: 6
5. Quality assurance: Quality assurance procedures are established and implemented by each cooperating agency. There is no information about QA directly available on the website
Score: 5
6. Data management: Data management procedures are established and implemented by CalFish's cooperating agencies. In addition, there is a broader effort among CalFish's participants to standardize formats to improve access to and integration of data from multiple sources. The website provides links to published data collection and documentation standards and encourages their broader use. Users are able to view data via two basic methods: querying the database tables directly or querying the data geographically. The geographical queries are made possible with an interactive on-line mapping system. This system also provides access to a broad array of framework data (political boundaries, hydrography, quad maps, and many more) that make the spatial data even easier to analyze and understand. Because the tabular and geographical databases are linked, users can move easily between the two systems
Score: 7
7. Data analysis and assessment: Given the wide range of issues related to anadromous fisheries, there is no single statewide assessment approach adopted by all agencies. Instead, data analysis and assessment is conducted by CalFish's cooperating agencies to meet their specific needs. However, the website provides descriptions of and links to assessment tools that may be of use to broader audiences, such as a method, developed by the Department of Fish and Game Information Services Branch for deriving salmonid distribution from existing observation data and creating GIS layers identifying this distribution. As another example, the interactive mapping

tool enables users to map a wide variety of abundance and distribution data against various habitat, water quality, and management parameters

Score: 7

8. Reporting: CalFish produces no reports of its own, though a variety of assessment reports are available from each of the cooperating agencies. CalFish does allow users to search the integrated database and create custom reports on population trends and counts, distributions, migration barriers, and fish genetics, as well as view information on individual monitoring programs, hatcheries, and habitat restoration projects

Score: 7

9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Sample webpages:

The screenshot shows the CalFish website homepage. The browser window title is "CalFish Portal - Home - Mozilla Firefox". The address bar shows the URL "http://www.calfish.org/portals/2/Home/tabid/70/Default.aspx". The website header features the "CALFISH" logo and the text "A CALIFORNIA COOPERATIVE ANADROMOUS FISH AND HABITAT DATA PROGRAM". Navigation links include "Home", "About CalFish", "Tutorials", "Search", and "Contact Us". The date "Thursday, August 14, 2008" is displayed. A "Welcome to CalFish" banner is present. A sidebar menu lists categories like "Fish Data and Maps", "Programs and Projects", and "People". The main content area includes a "Two-Fold Mission" section with descriptive text and logos for partner organizations: California Department of Fish and Game, NOAA Fisheries, Pacific States Marine Fisheries Commission, Caltrans, Coastal Conservancy, and the State of California Resources Agency. The footer contains "Site Designed by CDFG NENCR-15B", "Terms Of Use", and "Privacy Statement".

Welcome to CalFish

CALFISH

CalFish is a multi-agency cooperative program designed to gather, maintain, and disseminate fish and aquatic habitat data and data standards.

Two-Fold Mission:

To create, maintain, and enhance high quality, consistent data that are directly applicable to policy, planning, management, research, and recovery of anadromous fish and related aquatic resources in California; and

To provide data and information services in a timely manner in formats that meet the needs of users.

Subtheme: Coastal waters – reefs

Website: CDFG CRANE – <http://www.dfg.ca.gov/marine/fir/sss.asp#crane>; Reef Check – http://www.reefcheck.org/rcca/rcca_home.php

Sponsor: Department of Fish and Game; Reef Check

Contact: CRANE – Dan Pondella, Occidental College; Reef Check – Fiona Nagle, California Program Manager; William Golden, California Database Manager

Description: CDFG’s Cooperative Research and Assessment of Nearshore Ecosystems (CRANE) is a collaborative effort between the California Department of Fish and Game (CDFG), various universities, private organizations, and government programs to gather and report data for fishery management and performance of marine protected areas. In 2004, funding was available for a wide-scale survey and report of fish and invertebrate populations in shallow, rocky habitats accessible to divers (Monterey to San Diego, including the Channel Islands). Reef Check California aims to support the CRANE program by establishing a network of volunteers trained to carry out surveys of nearshore reefs providing data on the status of key indicator species.

Evaluation of 10 elements:

1. Strategy: The programs ask and answer clear questions, with specific audiences in mind. However, there is no direct link to management actions
Score: 7
2. Monitoring objectives: Specific monitoring objectives are stated on the Reef Check website (but not the CRANE website) and are to assess the relative abundance and size distribution of target species and how these parameters are changing over time. This will permit the evaluation of population and community attributes at sites inside and outside of existing and proposed Marine Protected Areas and will provide insight into how different sites respond to newly imposed management measures
Score: 10
3. Monitoring design: The monitoring design is standardized statewide and is described in CRANE’s 2006 summary report and in detail on the Reef Check website. Both programs have scientific advisory teams who provide input and feedback to ensure the scientific quality of the programs’ data
Score: 10
4. Indicators: Indicators are standardized statewide and are described in CRANE’s 2006 summary report and on the Reef Check website
Score: 10
5. Quality assurance: Basic QA procedures is described very briefly in CRANE’s 2006 report. A quality assurance plan, with detailed procedures, is posted on Reef Check’s website. These procedures are included in the 4 – 5 day volunteer training program, which includes both classroom and field training in the sampling and data management protocols
Score: 6
6. Data management: The basic data flow is described in CRANE’s 2006 report. Reef Check’s data management procedures are well established and clearly defined, and include standardized data entry forms. The program has a designated full-time database manager. Summarized data (e.g., mean, standard error) are available as tables in a PDF document. However, there are no tools for searching or downloading raw data from either website or exporting them to other formats
Score: 7
7. Data analysis and assessment: Data analysis methods are described in CRANE’s 2006 summary report and Reef Check’s 2006 – 97 report, and consisted of the preparation of summary descriptive statistics, correlation analyses, and multivariate pattern analysis. There are no assessment frameworks or thresholds for evaluating and comparing condition

Score: 6

8. Reporting: Data summary reports and the 2006 analysis and assessment report are available on the CRANE website. Reef Check also produced a two-year report assessing data collected in 2006 and 2007. Analyses included basic descriptions of abundance and distribution, as well as spatial pattern analyses. Users do not have the ability to define and run reports using their own criteria

Score: 6

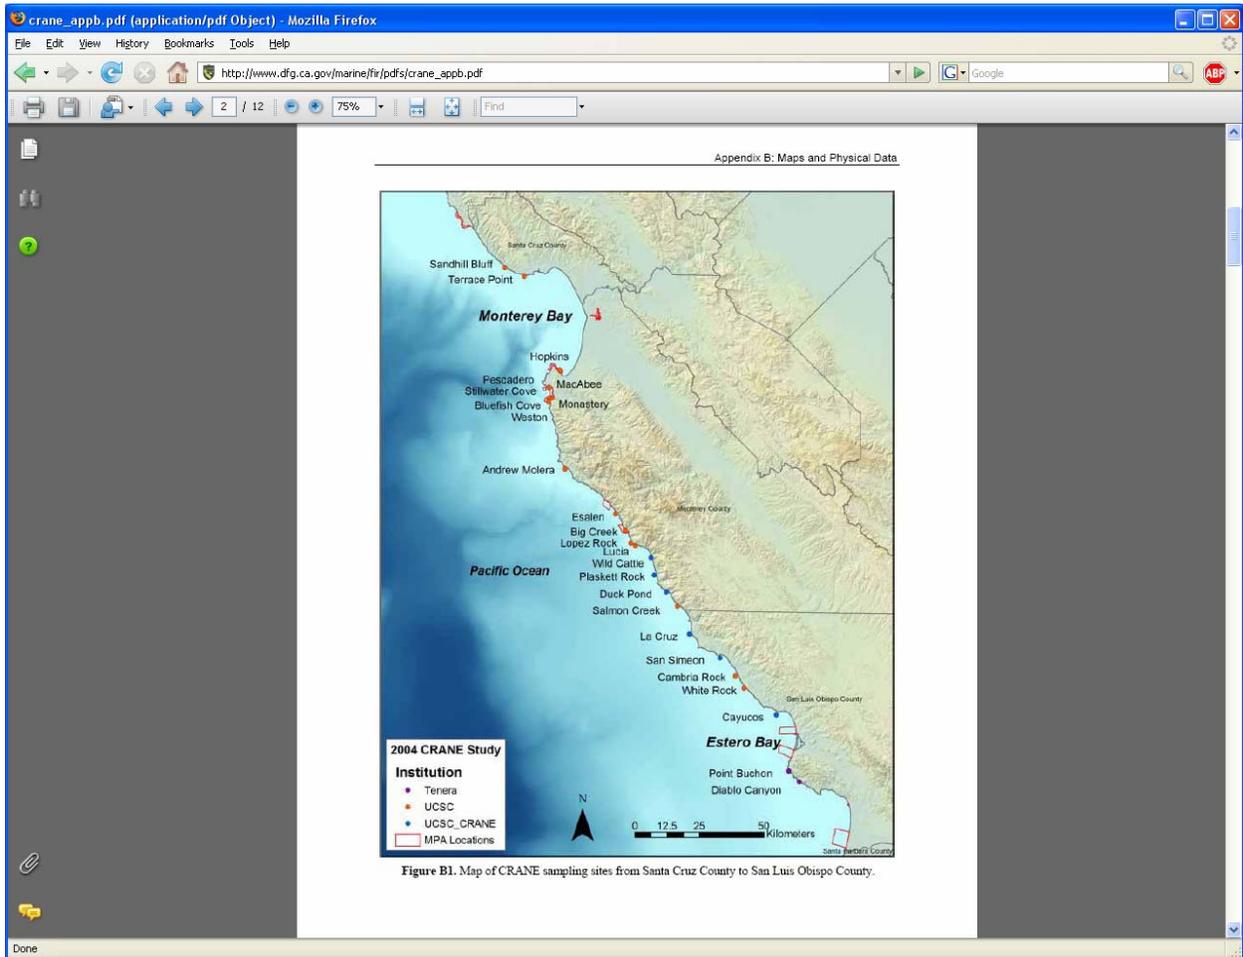

9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Reef Check California

Stretching over 1,000 miles, California's coastline is the gateway to a unique and often under-appreciated marine ecosystem. Offshore, just below the surface, kelp forests and rocky reefs play home to a vast array of marine life supporting a diverse array of consumptive and non-consumptive human uses. Unfortunately, similar to reefs around the world, the rapid growth of California's population, coastal development, pollution, and overfishing have placed increasing demands on our nearshore resources. Many organisms that were previously common in high numbers, like abalone, are now almost gone.

Reef Check California aims to build a network of informed and involved citizens who support the sustainable use and conservation of our nearshore marine resources. To accomplish this, volunteers will be trained to carry out surveys of nearshore reefs providing data on the status of key indicator species.

Subtheme: Coastal waters – aquatic life contamination

Website: NA

Sponsor: State Water Board

Contact: Dominic Gregorio, State Water Board

Description: The California Mussel Watch Program, which has just begun sampling, is based on NOAA's historical Status and Trends Program and is being conducted in coordination with NOAA. The program's goal is to continue the earlier time series of broad measures of coastal contamination.

Evaluation of 10 element:

1. Strategy: The program asks and answers a clear question, with specific audiences in mind
Score: 10
2. Monitoring objectives: Monitoring objectives have been clearly stated by the National Status and Trends Program program and are to track larger-scale patterns and longer-term trends in contamination of aquatic life in the coastal zone
Score: 10
3. Monitoring design: The monitoring design was established by the National Status and Trends Program and has been updated with new sites selected in coordination with the MARINE intertidal monitoring program. The monitoring design is described in work plans for the northern and southern California components of the program, but is not available online
Score: 10
4. Indicators: Indicators are well defined and standardized both nationally and statewide, and sampling methods are defined in standard operating procedures that are part of the workplans
Score: 10
5. Quality assurance: QA methods are well defined and standardized both nationally and statewide
Score: 10
6. Data management: The California program has only recently been restarted and data management procedures have not yet been established
Score: 0
7. Data analysis and assessment: Data analysis methods are standardized nationwide and consist primarily of descriptive summaries of patterns and trends. There are no assessment thresholds used to categorize condition. The State Water Board and NOAA are still in discussions regarding who will conduct data analysis
Score: 5
8. Reporting: The newly reconstituted program has not yet produced reports or developed a formal reporting strategy
Score: 0
9. Programmatic evaluation: No description of a periodic program evaluation process
Score: 0
10. Program planning: No information on assessment of or planning for future program needs
Score: 0

Sample website: NA

Subtheme: Bays and estuaries – sediment quality

Website:

http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/sedimentqual_baysestuarie.pdf

http://www.swrcb.ca.gov/water_issues/programs/bptcp/sediment.shtml

Sponsor: State Water Board

Contact: Steve Bay, SCCWRP

Description: This is a multiyear program to develop and implement objectives for enclosed bays and estuaries that protect aquatic ecosystems and human health from the direct (e.g., toxicity) and indirect (e.g., health impacts from eating contaminated seafood) effects of sediment contamination. The program has focused primarily on the development of an impact assessment framework and associated thresholds, monitoring methods, and standardized assessment tools. The program conducted a statewide assessment of sediment quality, using available data, to demonstrate the applicability of the approach and obtain an initial estimate of the percentage of the area of bays and estuaries falling into different categories of impact.

Evaluation of 10 elements:

1. Strategy: The program asks and answers a clear question, with specific audiences in mind
Score: 10
2. Monitoring objectives: The monitoring objective is to assess whether new sediment quality objectives are being met
Score: 10
3. Monitoring design: There was only a small amount of additional monitoring done specifically for this assessment; the assessment was based primarily on available data collected for other purposes. However, the data requirements of the SQO are prompting changes to existing monitoring designs so that all three lines of evidence are collected simultaneously. Spatial and temporal aspects of monitoring designs are only loosely defined by the policy and are left to the discretion of local agencies
Score: 5
4. Indicators: Indicators are standardized and well developed and described in summary form in the statewide assessment report and in greater technical detail in a series of reports available on the State Water Board's SQO website
Score: 10
5. Quality assurance: Data used in the assessment were rigorously checked and validated; however, there are no QA guidelines as part of the SQO policy or guidance materials
Score: 5
6. Data management: A statewide database was established for the 2008 assessment and is currently housed at SCCWRP. The database allows users to download data; however, it will not be integrated with SCCWRP's other internet-based data search tools because it includes data from other organizations. Procedures have not been established for ongoing capture of new monitoring data, maintenance of the database, or inclusion of the database in the BDAT/CEDEN system
Score: 3
7. Data analysis and assessment: Analysis and assessment follow detailed and standardized protocols described in summary in the statewide assessment report and in greater technical detail in a series of technical reports available on the State Water Board's SQO website. The assessment approach allows for examination of status and trends at the statewide and regional levels, and of condition at the local and site-specific levels
Score: 10
8. Reporting: A statewide assessment report is available on the SQO and SWAMP websites. However, there are no interactive features to enable users to focus on a specific area or directly

obtain the underlying data through a link to the database. Plans for future reporting have not been developed

Score: 4

9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Bay Protection and Toxic Cleanup Program - (BPTCP)

Sediment Quality Objectives

Sediments in bays and estuaries are often contaminated with a variety of pollutants stemming from sources including industrial and agricultural discharges, municipal wastewater treatment plants and stormwater. Exposure to contaminated sediments can have a significant effect on the health, diversity and abundance of invertebrates such as clams and worms. Foraging fish and birds may also be exposed by ingesting contaminated invertebrates or sediments. In turn, those organisms consuming contaminated fish may be exposed to toxic pollutants. These effects underscore the need to develop sediment quality objectives that protect aquatic ecosystems and human health.

The State Water Resources Control Board (State Water Board) intends to develop and adopt sediment quality objectives (SQOs) for enclosed bays and estuaries. This process will require approximately four years to complete. This page contains links to information on the State Water Board's progress.

Sample assessment products:

Subtheme: Bays and estuaries – San Francisco Bay

Website: <http://www.sfei.org/rmp/>

Sponsor: San Francisco Estuary Institute (SFEI)

Contact: Mike Connor, SFEI

Description: The Regional Monitoring Program for San Francisco Bay (RMP) is funded by a consortium of dischargers in the region and managed by a Steering Committee including consortium members and the Regional Water Board. The program's core focus is on

Evaluation of 10 elements:

1. Strategy: The program asks and answers clear questions, with a range of audiences in mind
Score: 10
2. Monitoring objectives: Monitoring objectives are reviewed and approved by Technical Review and Steering Committees and are explicitly stated on the program website. There are five higher-level objectives (e.g., Describe the distribution and trends of pollutant concentrations in the Estuary; Describe sources, pathways, and loading of pollutants entering the Estuary) which are then expanded by a series of detailed questions (e.g., For each pollutant of concern, what forms are released from each pathway and what are the magnitude and temporal variation of concentrations and loadings?)
Score: 10
3. Monitoring design: The RMP includes two sorts of monitoring designs, a stable status and trends design based on EPA's EMAP design that includes a rotating cycle of randomized stations, and targeted pilot and special studies designed to resolve shorter-term questions. Designs are well described on the program's website
Score: 10
4. Indicators: Indicators are standardized and well developed and described in summary form in the statewide assessment report and in greater technical detail in a series of reports available on SFEI's website
Score: 10
5. Quality assurance: The program has a QA officer and a detailed QAPP, which is regularly reviewed and updated. Quality control procedures and reports are available on the program's website
Score: 10
6. Data management: Data management procedures are well defined and managed by SFEI's database manager. Data for all program components (e.g., fish tissue, water) are readily available for search, viewing, and download from SFEI's website
Score: 10
7. Data analysis and assessment: A variety of analysis and assessment approaches are used to address the program's specific objectives. These approaches are reviewed and updated by the program's Technical Advisory and Steering Committees. However, there are no specific assessment thresholds for categorizing condition
Score: 8
8. Reporting: The program produces two annual reports, one containing the complete results of all status and trends monitoring and the Pulse of the Estuary which summarizes findings for a more general audience. The website also provides links to numerous additional publications based on the program's monitoring data. However, there are no interactive features in these reports to enable users to focus on a specific area or directly obtain the underlying data through a link to the database
Score: 8
9. Programmatic evaluation: The program undergoes periodic (every five years) external reviews of all aspects of its design, implementation, and management. Recommendations resulting from

these reviews are addressed by the program's standing committees as well as ad hoc workgroups established to consider specific topics

Score: 10

10. Program planning: SFEI prepares annual budgets and program plans for the RMP which are reviewed by the Steering Committee. In addition, SFEI conducts longer-term planning, under the guidance of its board of directors, which includes consideration of the staffing and infrastructure needs of all programs, including the RMP

Score: 10

Sample webpages:

The screenshot shows a web browser window with the URL <http://www.sfei.org/rmp/>. The page header features the San Francisco Estuary Institute logo and a navigation menu with links for Home, About Us, Programs and Projects, Documents and Reports, Data, Links, and Search. Below the header, there is a secondary navigation menu for RMP, including links for Home, Program Information, Meeting Minutes & Agendas, Status & Trends Monitoring, Pilot & Special Studies, Committees & Work Groups, Data Access, Documents, and Glossary.

Regional Monitoring Program (RMP)

The RMP is SFEI's largest program and monitors contamination in the Estuary. It provides water quality regulators information they need to manage the Estuary effectively. The RMP is an innovative collaborative effort between SFEI, the Regional Water Quality Control Board, and the regulated discharger community. For more details, view [Program Information](#).

36 / 92 90%

Mercury Mercury contamination is one of the top water quality concerns in the Estuary and mercury clean-up is a high priority of the Water Board. Mercury is a problem because it accumulates to high concentrations in some fish and wildlife species. The greatest health risks from mercury are generally faced by humans and wildlife that consume fish.

Methylmercury in Water (ng/L)

0.04 0.05 0.06 0.07 0.08 0.09 0.1 0.11 and above

Footnote: Plot based on 31 RMP data points from 2006. Earlier years not included because a less sensitive method was employed. The maximum concentration was 0.13 ng/L in Lower South Bay. Data are for total methylmercury.

Methylmercury in water, 2006. Mercury exists in many different forms in the aquatic environment. Methylmercury is the form that is readily accumulated in the food web and poses a toxicological threat to highly exposed species. Methylmercury has a complex cycle, influenced by many processes that are variable in space and time. The RMP measures methylmercury in water and sediment of the Bay in order to better understand the sources of the methylmercury that are accumulated by Bay fish and wildlife. Lower South Bay had the highest average concentration (0.11 ng/L) of any segment. No regulatory guideline exists for methylmercury in water.

Methylmercury in Sediment (ppb)

0.2 0.4 0.6 0.8 1 1.2 1.4 1.6 and above

Footnote: Plot based on 233 RMP data points over a five-year period from 2002 – 2006. The maximum concentration was 2.4 ppb in Central Bay in 2002.

Methylmercury in sediment, 2002 – 2006. Mercury is converted to methylmercury primarily by bacteria in sediment. Methylmercury production can vary tremendously over small distances and over short time periods, so this figure should be viewed as the result of several snapshots of conditions in the Bay at the time of the surveys in the summers of 2002 – 2006. Concentrations of methylmercury in sediment from the Bay Bridge south have been consistently higher than those in the northern Estuary. No regulatory guideline exists for methylmercury in sediment.

SFEI 00202

Small fish mercury monitoring is revealing the spatially and temporally dynamic nature of methylmercury concentrations in the Estuary. Small fish are an excellent indicator of fine-scale spatial and temporal patterns in mercury and wildlife exposure to mercury in aquatic ecosystems. Two studies in 2006 combined to provide thorough coverage of the Estuary. In the larger of the two studies, Darrell Slotton and colleagues at U.C. Davis have sampled large numbers of small fish of several species throughout the north Bay, Delta, and Central Valley in an effort to evaluate the local and regional impacts of habitat restoration on mercury in the food web. The most widespread species they sampled is the Mississippi silverside (*Menidia audens*), which has proven to be a particularly effective mercury indicator for the Estuary. The fish sampled are only a few months old and are good indicators of recent concentrations of methylmercury in the food web.

One highlight of the extensive silverside sampling by U.C. Davis in 2006 (blue bars) was the low mercury concentrations observed in the Napa Marsh complex. The former salt ponds of the Napa Marsh are the site of some of the most extensive wetland restoration activities in the Bay-Delta watershed. Mercury concentrations observed in this region in 2005 were low, and concentrations in 2006 were even lower. Silversides collected within the recently breached Pond 4/5 complex not only contained dramatically lower mercury than all other samples in the local region, they had the lowest mercury ever recorded for this species across the entire watershed, averaging 14 ppb. These data indicate that some wetlands, even during restoration, can be methylmercury sinks, contrary to the common expectation that they would be methylmercury sources. Other surprises from the 2006 sampling by U.C. Davis were high concentrations along the Petaluma River, an area not previously known for methylmercury contamination, and high concentrations in Suisun Marsh, an area that had much lower concentrations in 2005. Most notable were previously unknown seasonal spikes in small fish mercury, to levels significantly above the fall concentrations shown in the Figure (to as high as 1000 ppb). These were all associated with various forms of seasonal or episodic flooding of dry soils.

The RMP also performed a complementary smaller study of mercury in Mississippi silverside and other small fish species in the Estuary in 2006 (pink bars). Concentrations in the South Bay were high compared to the rest of the Estuary, but a bit lower than observed in South Bay in 2005. The highest concentration at RMP sites in 2006 was measured at a Central Bay location that was not sampled in 2005.

Footnote: Inset shows bars on a common scale for direct comparison.

Done

Subtheme: Wetlands

Website: CRAM – <http://www.cramwetlands.org/>; Wetland Tracker - <http://www.wetlandtracker.org/>

Sponsor: State Water Board; California Wetlands Information System – Resources Agency

Contact: CRAM and Wetland Tracker – Josh Collins, SFEI

Description: The California Rapid Assessment Method (CRAM) is a standardized, cost-effective tool for assessing the health of wetlands and riparian habitats. CRAM software guides users through assessment procedures that are applicable to all wetland types. It is designed for assessing ambient conditions within watersheds, regions, and throughout the State. It can also be used to assess the performance of compensatory mitigation projects and restoration projects. The CRAM portal provides a mechanism for independent monitoring programs to apply the method and enter their data into a centralized system. CRAM data and results are also accessible through the State Water Board's Wetland Tracker, which is intended to eventually become the portal for entry into all wetlands monitoring and assessment data for the state.

Evaluation of 10 elements:

1. Strategy: The program asks and answers a clear question, with specific audiences in mind
Score: 10
2. Monitoring objective: The monitoring objective is to provide rapid, scientifically defensible, standardized, cost-effective assessments of the status and trends in the condition of wetlands and related policies, programs and projects throughout California
Score: 10
3. Monitoring design: There is a three-level monitoring design, recommend by the Wetlands Recovery Project. However, this is not universally applied and individual monitoring programs with somewhat different designs can all enter their data into the CRAM database
Score: 7
4. Indicators: Indicators and monitoring methods are well developed and standardized, though they are in the last phase of field testing and final revision. The schedule for training sessions is posted on the CRAM website, as are detailed methods manuals and user guides
Score: 10
5. Quality assurance: There is no systematic QA applied to data submitted to the site. Funds exist (104b3 and CIAP) to develop regional "audit teams" of trained CRAM experts for coastal regions that will provide third-party review of selected CRAM results by re-CRAMming the sites
Score: 5
6. Data management: Data management procedures are well established and data are housed in a database maintained by SFEI. The CRAM methodology is being field tested and finalized and the CRAM database is being updated regularly to reflect these adjustments and will not be integrated with BDAT / CEDEN until it has stabilized. The database has preprogrammed routines for remote data entry by participants. At this time, there are no tools for search, selecting, and downloading data, although this functionality is included in the CIAP project that begins this fall. The funded task includes downloading by site, combination of sites, wetland type, watershed (Cal Water 2), congressional district, Water Board, and statewide
Score: 7
7. Data analysis and assessment: CRAM is level 2 of a three-level assessment strategy for wetlands that begins at the landscape level and ends at the detailed site level. Assessment thresholds are well developed and standardized statewide. Software to apply the CRAM metrics and user manuals are available for download from the program's website. The CRAM database will eventually be merged with the Wetland Tracker database to allow users to visualize extent and condition assessments simultaneously. For each wetland type, at each of several scales, Wetland Tracker will generate a "report" of the size-frequency of all wetland polygons, the size-frequency

of the wetland polygons for projects, the CRAM condition frequency (by attribute and site score) for all sites, and for project sites

Score: 8

8. Reporting: The website has a Google Maps interface that displays all wetlands in the system. Clicking on specific sites brings up summary information for that wetland and a chart of CRAM scores. Wetlands can also be selected from a drop-down list of available sites. Wetlands can also be viewed regionally via the interactive mapping function of Wetland Tracker (www.wetlandtracker.org), although not all wetland scores are visible at every scale. However, no reports summarizing and synthesizing results have been prepared. Access to these and other information about wetlands will be centralized through a main wetlands portal, perhaps CERES, that has not yet been decided

Score: 7

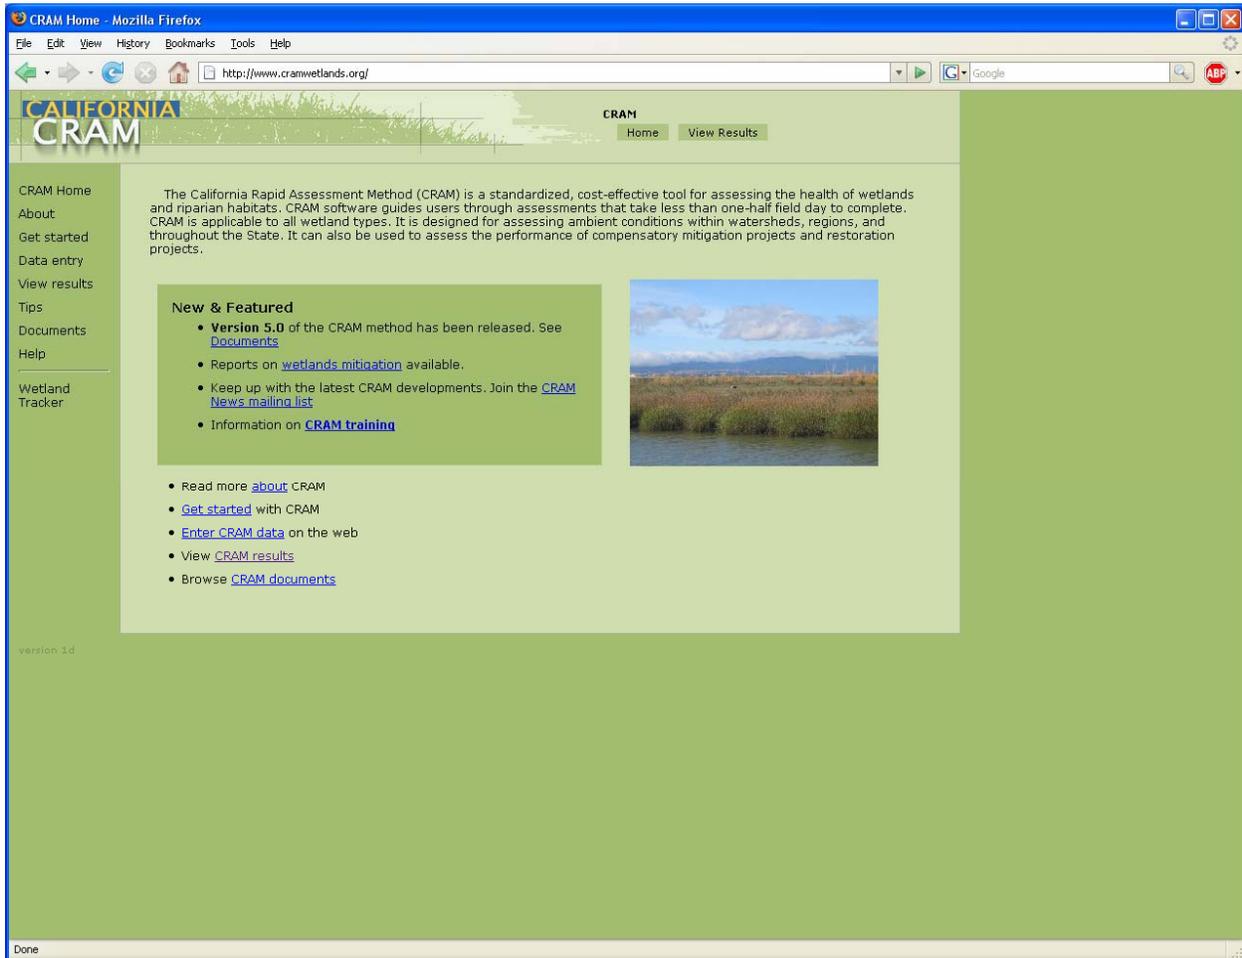

9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Transferring data from www.cramwetlands.org...

Subtheme: Intertidal

Website: <http://www.marine.gov/>

Sponsor: Cooperative interagency group

Contact: Pete Raimondi, UC Santa Cruz

Description: The MARINE partnership of local, State, and Federal agencies, universities and private organizations monitors rocky intertidal sites along the coast of California, including the islands, on a long-term basis. It represents the largest program of its kind on the west coast. Many of the sites have been monitored consistently for 15-20 years. A standardized set of Core Protocols are used to monitor rocky intertidal habitat each fall and spring at 89 MARINE sites. These data are funded by multiple partners and are entered into a common database for analysis. Sites are spaced every 10 to 15 miles along the coast on the mainland and offshore islands. Continuous monitoring provides resource managers with early warnings of abnormal conditions, such as the discovery of the withering foot syndrome which has affected black abalone across the coast.

Evaluation of 10 elements:

1. Strategy: MARINE asks and answers clearly defined set of questions about status and long-term trends, as defined by an interagency Steering Committee
Score: 10
2. Monitoring objectives: Specific monitoring objectives are not defined on the program's website, but can be inferred from the program's overall goals and the analysis approaches
Score: 5
3. Monitoring design: The monitoring and sampling protocols are established by an interagency Science Panel. These are standardized statewide and described in detail on the program's website and in publications and reports accessible from the website. The monitoring design and sampling protocols are targeted directly at the program's goals to describe status and long-term trends
Score: 10
4. Indicators: Indicators are standardized statewide, with allowances for differences in species distributions, and are described on the program's website and in reports and publications available from the website
Score: 10
5. Quality assurance: QA is conducted by each program partner; however, QA methods are not described on the program's website
Score: 3
6. Data management: Data management protocols are established by a Database Panel, but are not described on the program's website or in any reports listed on the website. Data are transferred to a central database, which is currently being organized with standardized formats. Data are not available remotely but must be requested from the MARINE program
Score: 4
7. Data analysis and assessment: The program is working with state agencies in their evaluation of discharges into Areas of Special Biological Significance, and with monitoring of marine protected areas. Indices of intertidal community health being generated by MARINE will allow condition to be categorized and federal and state agencies to assess measures to reduce impacts to this critical shoreline habitat. The website enables users to generate simple time plots of the abundance of individual species at specific sites
Score: 7
8. Reporting: MARINE partners have produced a large number of reports and publication based on the program's monitoring data, and these are listed on the program's website
Score: 10
9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Inventories

In addition to the portals described above, which are specific to a theme or subtheme, broader inventory websites provide access to a wide range of programmatic, mapping, monitoring, and assessment data, much of which is essential to interpreting the more targeted monitoring data collected to evaluate each subtheme. The Resources Agency maintains many such inventories, a few of which are described below. An important issue for future planning is to define the links both among the inventories themselves and between the inventories and the issue-specific portals.

Bay Delta and Tributaries Project (BDAT)

Website: <http://baydelta.ca.gov/>

Sponsor: Resources Agency

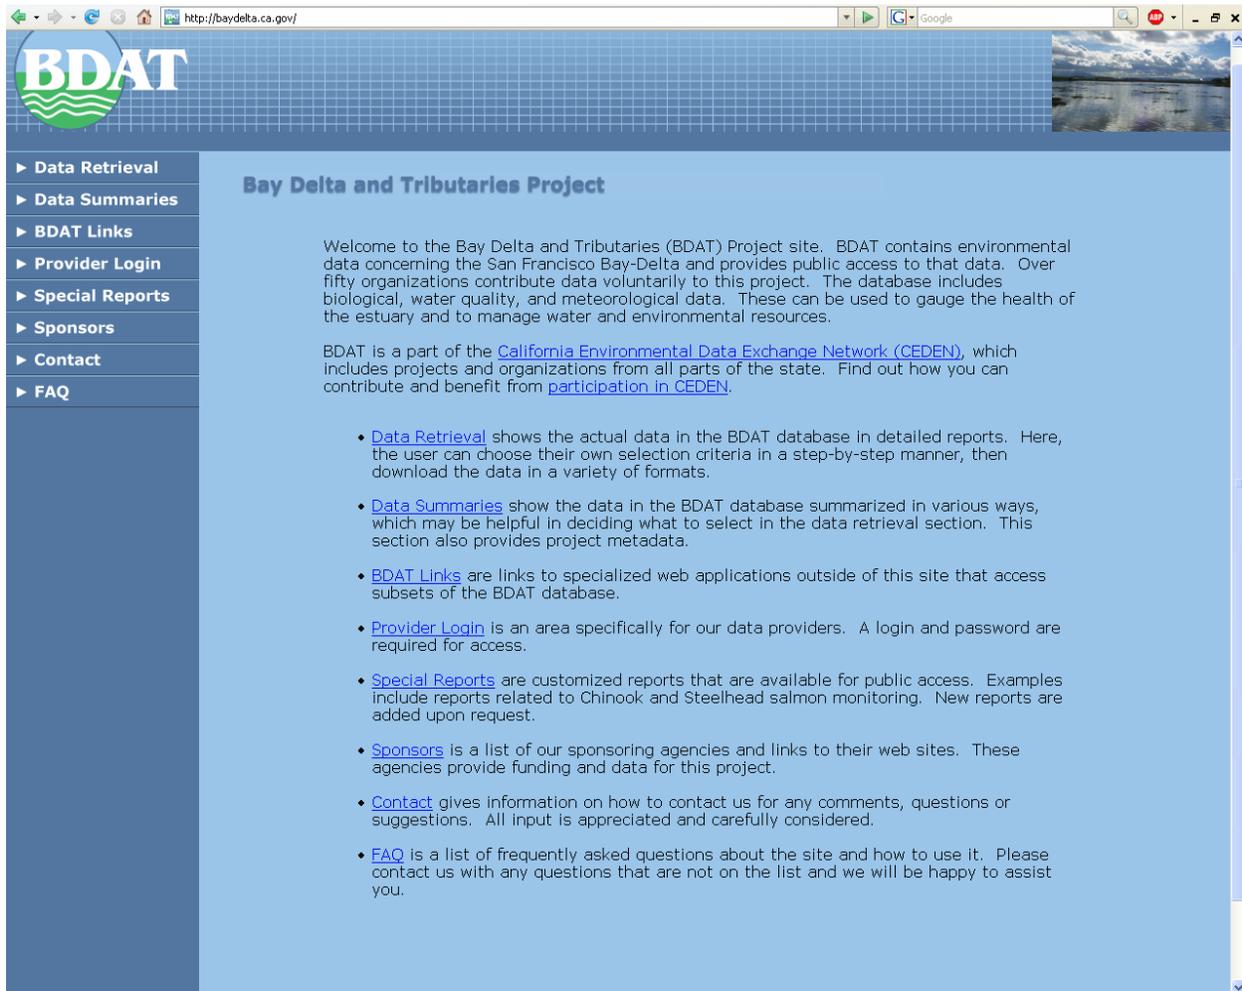

Contact: Karl Jacobs, State Water Board

Description: BDAT contains environmental data concerning the San Francisco Bay-Delta and provides public access to that data. Over fifty organizations contribute data voluntarily to this project. The database includes biological, water quality, and meteorological data. These can be used to gauge the health of the estuary and to manage water and environmental resources. BDAT is a part of the California Environmental Data Exchange Network (CEDEN), which includes projects and organizations from all parts of the state.

Evaluation of 10 elements:

1. Strategy: This is not a monitoring program; its strategy is to improve access to scientific data about the San Francisco Bay-Delta by providing a single access point to biological and hydrological data on the Bay-Delta
Score: 10
2. Monitoring objectives: NA
3. Monitoring design: NA
4. Indicators: The program includes a wide range of data types (e.g., fish, benthos, water quality); specific indicators are defined by the individual contributing partners' programs. These are not defined or described on the BDAT website
Score: 5
5. Quality assurance: BDAT obtains data directly from other sources and conducts no additional QA procedures to ensure their accuracy. Some data sources have sophisticated QA procedures, while data from other sources may be less well validated. BDAT provides no information about the QA procedures applied by contributors
Score: 0
6. Data management: The database structure is well developed and is based on linking to other data sources each of which has their own data management procedures. Data can be searched for and retrieved from a variety of perspectives, including category (e.g., atmospheric, benthic, fisheries, plankton), project, location, or species, and the system includes a customized time series graphing tool
Score: 10
7. Data analysis and assessment: NA
8. Reporting: NA
9. Programmatic evaluation: No description of a periodic program evaluation process
Score: 0
10. Program planning: No information on assessment of or planning for future program needs
Score: 0

Sample webpages:

Sample assessment products: NA

California Data Exchange Center (CDEC)

Website: <http://cdec.water.ca.gov/>

Sponsor: Resources Agency

Contact: Karl Jacobs, State Water Board

Description: The California Data Exchange Center (CDEC) installs, maintains, and operates an extensive hydrologic data collection network including automatic snow reporting gages for the Cooperative Snow Surveys Program and precipitation and river stage sensors for flood forecasting. CDEC provides a centralized location to store and process real-time hydrologic information gathered by various cooperators throughout the State. CDEC then disseminates this information to the cooperators, public and private agencies, and news media.

Evaluation of 10 elements:

1. Strategy: The program meets well-defined information needs of specific audiences
Score: 10
2. Monitoring objectives: The program's monitoring objectives are to provide real-time hydrologic information
Score: 10
3. Monitoring design: There is no standardized monitoring design applied statewide. CDEC obtains and organizes data provided by a wide range of cooperative partners, each with its own monitoring design
Score: 3
4. Indicators: The basic set of hydrologic indicators is well defined and methods are standardized to some degree across the major participating agencies
Score: 5
5. Quality assurance: CDEC's emphasis on the provision of real-time data for specific decision-making needs precludes the application of rigorous quality checks of the data. The time required for such QA would make the data substantially less useful to the program's customers. The level of QA is appropriate to the needs of the users and, after much discussion, the program decided that correcting inaccuracies in the data and releasing revised datasets would not be worth the effort. The program's website notes that data are preliminary in nature. However, the level of quality assurance applied to the data is not documented on the program's website
Score: 2
6. Data management: Data management procedures are well defined and systematically applied. CDEC operates a data exchange program with various federal and state agencies and other public agencies. This data exchange program involves the automated transfer and receipt of data and information via network connections. Automated query routines permit searches by station, parameter, and a variety of other entry points
Score: 10
7. Data analysis and assessment: There is little analysis or assessment, since CDEC's primary purpose is to ensure the ready availability of real-time hydrologic data. However, an automated data plotting tool enables users to prepare graphs of query results. The program's website has clear instructions and is suited for both public access and to provide data downloads for analysts and researchers
Score: 5
8. Reporting: CDEC's website provides access to a large number of reports, the majority of which are data reports on various aspects of hydrologic condition. There are no provisions for interactive reports except as noted under #7
Score: 8
9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Sample webpages:

The screenshot shows the California Data Exchange Center website in a Mozilla Firefox browser window. The browser's address bar displays <http://cdec.water.ca.gov/>. The website header features the CA.GOV logo and the text "Department of Water Resources California Data Exchange Center". A search bar is located in the top right corner, with "California" selected. A navigation menu below the header includes links for Home, Query Tools, Precipitation, River Forecast, River Stages/Flow, Reservoirs, Snow, Stations, and Weather. Below the navigation menu, there are three main content areas: "MOST POPULAR LINKS" on the left, "CURRENT CONDITIONS" and "MORE INFORMATION" in the top right, and "ANNOUNCEMENTS" in the center. The "ANNOUNCEMENTS" section contains two news items: "California Data Exchange Center Receives Award" and "Latest Weather and Climate Newsletter June 19, 2008". Below the announcements is a "BROWSE CDEC" section with a grid of letters A through Z. The footer of the website includes links for "Back to Top", "Help", "Comments or Suggestions", and "Document Viewers".

Sample assessment products:

California Spatial Information Library (CaSIL)

Website: <http://gis.ca.gov/index.epl>

Sponsor: Resources Agency

Contact: Sam Harader, Resources Agency

Description: CaSIL is the California Geographic Information Systems (GIS) web portal. Its ongoing development, managed by the California Mapping Coordinating Committee (CMCC), focuses on developing a series of GIS-related web pages to provide information on state government GIS activities, access to statewide GIS data, and links to the larger California GIS community.

Evaluation of 10 elements:

1. Strategy: This is not a monitoring program, but its data acquisition and integration strategy is clearly defined and targeted at providing easier access to particular kinds of maps and map-based data to a broad range of potential audiences

Score: 10

2. Monitoring objectives: NA

3. Monitoring design: NA

4. Indicators: The program focuses on well-defined types of data and information developed by others. Indicators are defined by these other data sources and are not described in detail on the CaSIL website

Score: 5

5. Quality assurance: CaSIL obtains data directly from other sources and conducts no additional QA procedures to ensure their accuracy. Some data sources, such as USGS, have sophisticated QA procedures, while data from other sources may be less well validated. CaSIL posts a disclaimer on its website notifying users that it does not guarantee the accuracy or reliability of any data accessed through the site. However, the level of quality assurance applied to the data is not documented on the program's website

Score: 0

6. Data management: Data management procedures are well defined and carefully implemented. Data management is overseen by the California Mapping Coordinating Committee, in partnership with other partners such as the Federal Geographic Data Committee and the California Geographic Information Association. The goal of these relationships is to improve the ability to locate, access, share, and integrate map-based data from a variety of sources. CaSIL data holdings can be accessed by FTP or HTTP and treated as one large file system. The collections are organized by contributing agency. The system has an online users' guide that provides instructions for data access and download

Score: 10

7. Data analysis and assessment: NA

8. Reporting: CaSIL provides a range of options for searching, investigating, combining, and acquiring a range of data types. For example, an interactive mapping tool enables users to drill down through a map of California using a variety of boundary and location definitions to obtain orthophoto quads, USGS map sheets, and species data from Fish and Game's Natural Diversity Database. The system includes links to the websites of other program partners who post data summary and assessment reports on their websites. However, CaSIL's goal is not to conduct independent data analyses or assessments

Score: 10

9. Programmatic evaluation: No description of a periodic program evaluation process

Score: 0

10. Program planning: No information on assessment of or planning for future program needs

Score: 0

Sample webpages:

The screenshot shows a Mozilla Firefox browser window displaying the California Spatial Information Library website. The browser's address bar shows the URL <http://gis.ca.gov/data.epl>. The website header includes "California Home" and the date "Saturday, July 19, 2008". A banner image says "Welcome to California" with a collage of California landmarks. The main content area is titled "The California Spatial Information Library" and features a search bar with a "go" button and radio buttons for "My CA" and "This Site". Below this is a "Data Collections" section with three items:

- Frequently Accessed Data Layers**: A collection of commonly used GIS datasets for California, including datasets from the Teale Data Center, maintained in an Albers projection.
- Digital Orthophoto Quadrangle GeoTiff (DOQQ)**: Orthophotos combining image characteristics with map geometry. The primary DOQ is 1-meter resolution, quarter-quadrangle (3.75-minutes of latitude by 3.75-minutes of longitude) image cast on the UTM projection on the NAD83 datum.
- California Digital Raster Graphics**: A raster image of a scanned USGS topographic map including collar information. DRG images for California are available in Albers equal area projection. DRGs are useful as a source or background layer in a GIS, for quality assurance, and as a source for collection and revision of DLG data.
- California Landsat-7 Images**: A product created by the U.S. Geological Survey (USGS) containing Landsat data files in GeoTIFF format. It includes data from Landsat 1, 2, 3, 4, and 5 satellites.

California Environmental Information Clearing House (CEIC)

Website: <http://gis.ca.gov/catalog/>

Sponsor: Resources Agency

Contact: Karl Jacobs, State Water Board

Description: The California Environmental Information Clearinghouse (CEIC) uses the CERES Catalog as an online directory for reporting and discovery of information resources for California. Participants include cities, counties, utilities, state and federal agencies, private businesses and academic institutions that have spatial and other types of data resources. The Catalog has been developed through a collaborative effort with the California Geographic Information Association, California Environmental Resources Evaluation System, and the Federal Geographic Data Committee.

Evaluation of 10 elements:

1. Strategy: This is not a monitoring program; its strategy is to provide the greatest possible access to a wide variety of environmental information
Score: 6
2. Monitoring objectives: NA
3. Monitoring design: NA
4. Indicators: The program's scope includes virtually all types of environmental data and information; these datatypes are not defined further on the CEIC website
Score: 2
5. Quality assurance: CEIC links directly to data and information on other websites and conducts no additional QA procedures to ensure their accuracy. Some data sources have sophisticated QA procedures, while others do not; CEIC provides no information about relative levels of QA
Score: 0
6. Data management: The database structure is well developed and is based on providing the ability for partners to create new catalogs to make their data resources available through CEIC. CEIC provides a wide variety of entry points for searches, including map-based, keyword, agency name, and project name. Catalogs can also be browsed alphabetically. However, the system does not impose any structure of its own on information resources
Score: 6
7. Data analysis and assessment: NA
8. Reporting: NA
9. Programmatic evaluation: No description of a periodic program evaluation process
Score: 0
10. Program planning: No information on assessment of or planning for future program needs
Score: 0

Sample webpages:

The screenshot shows a Mozilla Firefox browser window displaying the CEIC (California Environmental Information Clearinghouse) website. The address bar shows the URL <http://ceic.resources.ca.gov/catalog.html>. The page header includes the CA.GOV logo, the text "CALIFORNIA resources AGENCY", and "CALIFORNIA ENVIRONMENTAL INFORMATION CLEARINGHOUSE". Navigation links for "Home", "Discover", and "Contribute" are visible. A search bar is located in the top right corner.

The main content area is titled "Catalog" and features a sidebar on the left with sections for "Governor Schwarzenegger", "Powered By CERES", "Quick Links", and "News". The "Quick Links" section includes links to "Resources Agency GIO", "California Environmental Resources Evaluation System", "California Spatial Information Library", and "Resources Agency". The "News" section includes links to "Fellowships Available in Estuarine Science, Deadline: June 6, 2008", "Conservation Easements Registry Now Available", "A new CERES service! California Military Land Use Compatibility Analyst (CMLUCA)", and "2005 California Watershed Forum".

The main catalog area contains a search box labeled "Find a catalog by name:" with a "clear" button. Below the search box is a list of "Contributing Catalogs to CEIC" with the following entries:

San Joaquin River Monitoring & Assessment Strategy – Monitoring Directory

Website: <http://www.sanjoaquinmonitoring.org/>

Sponsor: San Francisco Estuary Institute

Contact: Thomas Jabusch, SFEI

Description: This website contains an interactive directory of current water quality monitoring efforts in the San Joaquin basin to facilitate monitoring coordination and integration.

Evaluation of 10 elements:

1. Strategy: The program's intent is to provide a single point of access for monitoring data within the San Joaquin River watershed
Score: 10
2. Monitoring objectives: NA
3. Monitoring design: NA
4. Indicators: NA
5. Quality assurance: Descriptive information about individual monitoring programs (e.g., objectives, duration, sites, monitoring designs, data availability) is carefully reviewed before being entered into the database. However, there are no systematic procedures in place for routine review and updating of information in the directory
Score: 6
6. Data management: Data management procedures are well established and information is housed in a database at SFEI. There is no direct access to data from the Directory website; however, users can follow links to individual program websites, where reports, maps, and data downloads are possible, depending on the policies and capabilities of those individual program websites
Score: 7
7. Data analysis and assessment: NA
8. Reporting: The database provides a variety of search routines, including customized queries and map-based interfaces
Score: 4
9. Programmatic evaluation: No description of a periodic program evaluation process
Score: 0
10. Program planning: No information on assessment of or planning for future program needs
Score: 0

Beta Version
SAN JOAQUIN RIVER
Monitoring & Assessment Strategy

The purpose of this project is to encourage a public-private partnership to produce needed information for more effective water quality management. The envisioned approach is that by establishing a framework of shared objectives and activities, and identifying ways to provide for improved coordination, management, and funding, a system can be developed for improved monitoring and assessment of water quality in the San Joaquin River Region.

click to view map

Project Highlights:

ONLINE MONITORING DIRECTORY	MONITORING AND ASSESSMENT STRATEGY
An interactive directory of current water quality monitoring efforts in the San Joaquin basin to facilitate monitoring coordination and integration. Features include: <ul style="list-style-type: none">Monitoring program information (objectives, duration, funding) and metadata (sampling sites, frequency, parameters, data availability)A search form for customized searches;An interactive map for GIS based searching and viewing of monitoring locations and program information;Password-protected domains as a convenient tool for program managers to keep monitoring information updated.	A strategy for San Joaquin water quality monitoring and assessment will be established through a participatory process involving state and federal agencies, the regulated community, technical experts, water resources managers, and policy decision-makers.

EVENTS

THE PROJECT is technically directed and staffed by the San Francisco Estuary Institute (SFEI), with funding and participation from the U.S. Environmental Protection Agency (EPA), and in consultation with the Central Valley Regional Water Quality Control Board and other agencies. The Great Valley Center participates in meeting facilitation, stakeholder outreach, and project coordination.
